## Error Log Entry

What error message did you encounter (if any)?

For this program, I didn't really have any errors that came up with its code. However, I did have trouble when using the int and double.

What unexpected behavior did your program exhibit?

When I had made the code get the int of the total percentage, I didn't really account for how int meant no decimals. So when I ran my code, despite the numbers inputted the final percentages displayed were all 0%

What caused the issue? (e.g., syntax error, logic error, incorrect function usage, etc.)

It was that instead of using double, as I needed to, I instead used a int making an incorrect function use.

Include a screenshot of specific lines of code.

```
int total = food + clothing + entertainment + rent;
```

How did you fix the issue?

I really struggled on how to fix it initially, so I went to ChatGPT and inserted my code and asked it what the problem was. It gave me a short explanation and told me instead of using int use double instead

Provide the corrected code or solution using a screenshot.

```
double total = food + clothing + entertainment + rent;
```
